UNIVERSITY ASSIGNMENT REVIEW SYSTEM

A university department receives student assignments throughout the day. Due to deadline pressure, faculty members review submissions in reverse order of arrival, but they also need to maintain fairness and track performance.

Each submission contains:

- Student ID
- Subject
- Assignment topic
- Marks (to be evaluated later)

Situation:

Assignments arrive continuously and are stored for evaluation. However:

- Latest submissions are checked first
- Faculty also needs performance statistics

Student Activity (Group of 3):

Students must design a full stack-based workflow and answer:

1. Design how assignment records will be stored in stack form.

2. Why is LIFO behavior useful in this evaluation system?
3. Explain step-by-step:
    - How new submissions are added
    - How evaluation happens
4. Simulate a scenario with at least:
    - 7 submissions
    - 4 evaluations (pops)
5. How will you:
    - Find highest and lowest marks (without sorting entire data permanently)?
    - Calculate average marks of pending submissions?
6. What problems can occur if stack is the only structure used?
7. Propose one improvement using an additional stack or structure.

Twist (critical thinking):

- If a student requests “priority evaluation”, how will your design handle it?
- Can stack ensure fairness? Defend your answer
